

KEY TO THE SEMANTIC AND FUNCTIONAL SPECIFIERS TO LAEME LEXELS

(Thanks to Chloe Morgan for producing the first draft of this key)

Some lexels are followed by annotations in braces. These are specifiers indicating some semantic or functional distinction: e.g. \$about{p}/pr, \$about{re}/pr, \$about{t}/pr identify the prepositional lexel \$about when referring respectively to ‘place’, ‘concerning’ and ‘time’; \$be:am{l}/n and \$be:am{t}/n refer respectively to usages of the reflexes of OE *bēam* meaning ‘beam of light’ and ‘tree, timber’. After the first two, the specifiers below are listed in alphabetical order under a head letter. Where the specifier has semantic reference the gloss is given in small capitals. Where it refers to function its significance is given in inverted commas. Note that {*}, also found between the end of a lexel and the / separating it from its grammel, is not a semantic or functional specifier. It indicates that the lexel label is an unattested word in Old English, but is assumed to have been the origin of the forms it identifies. In the LAEME CTT this asterisk follows its lexel rather than precedes it so as not to upset the alphabetisation in text and tag dictionaries. The label {rh} is not a lexel specifier. It attaches not to a lexel but to the end of the grammel of a tag, and indicates that any forms associated with that tag are found in rhyme position.

X

Specifier {x} has two possible significations

{x} indicates that the derivational suffix \$-ster attached to female agentive nouns such as ‘deemster’ is here attached to the word ‘baxter’ in which stem-final [k] and suffix initial [s] are together realised as ‘x’, resulting in the detached suffix beginning with ‘t’ rather than ‘s’, in:

-ster{x}/xs-agt-n
 -ster{x}/xs-agt-n-voc
 -ster{x}/xs-agt-n<pr

{x} indicates co-reference with the subject, as in ‘by oneself’ or ‘of one’s own accord’ in:

by{x}/pr
